

LECTURE 5: C PROGRAMMING

Computer Systems and Networks

Dr. Pallipuram

(vpallipuramkrishnamani@pacific.edu)

Today's Class

- Pointer basics
- Pointers and multi-dimensional arrays
 - `malloc`, `calloc`, `free`
- 2D array manipulation for Lab 4
- Strings in C

Pointer Arithmetic

Only addition and subtraction are allowed with pointers.

All pointers increase and decrease by the length of the data-type they point to.

Example: If an integer pointer, `iptr` holds address 32, then after the expression `iptr++`, `iptr` will hold 36 (assuming integer is 4 bytes).

Problem 1

The name of the array is actually a pointer pointing to the first element of the array.

Consider an integer array named `array`.

Subscript	[0]	[1]	[2]	[3]	[4]
Value	5	6	4	8	2
Address	65528	65532	65536	65540	65544

```
printf("\n %u:",array); //prints 65528
printf("\n %u:array+2); //prints 65536
printf("\n %u:*(array+1)); //literally translates to array[1]
//Prints 6
```

```
printf("\n", %u:array+3); //prints?_____
printf("\n", %u:*(array+3)); //prints?_____
```

Two methods of traversing 1-D array

Pointer Method

```
for (i=0;i<arraysize;i++)  
    *(array+i)=*(array+i)+1;
```

//iterates through the
array and increments
contents by 1

Subscript Method

```
for (i=0;i<arraysize;i++)  
    array[i]=array[i]+1;
```

//iterates through the
array and increments
contents by 1

More intuitive

Pointers and Functions: Call by value vs. Call by reference

Call by value

these are just copies.
No change to original variables

```
main() {  
    a=5, b=6;  
    update(a, b);  
    printf("%d", a);  
}  
  
update(int a, int b)  
{  
    a=a-b;  
}
```

modification to actual variable

Call by reference (pointer)

```
main() {  
    a=5, b=6;  
    update(&a, &b);  
    printf("%d", a);  
}  
  
update(int *a, int *b)  
{  
    *a=*a-*b;  
}
```

Example: Modify an array using function call

```
main(){
//assume int array a of size 5
update(a,5); //name of array is starting addr.
}

update(int *a,int size) {
int i=0;
for(i=0;i<size;i++)
    a[i]++;
}
```

Malloc – 1D

```
int *array; //array of integers
array = (int *)malloc(sizeof(int)*5);
```

address:
value:

60	64	68	72	76
array[0]	array[1]	array[2]	array[3]	array[4]

array (pointer variable)

value: 60

pointer's addr: 32

Malloc – 2D Allocate 4x5 integers (important for lab 4)

```
int **array; //a double pointer
array = (int **)malloc(sizeof(int *)*4);

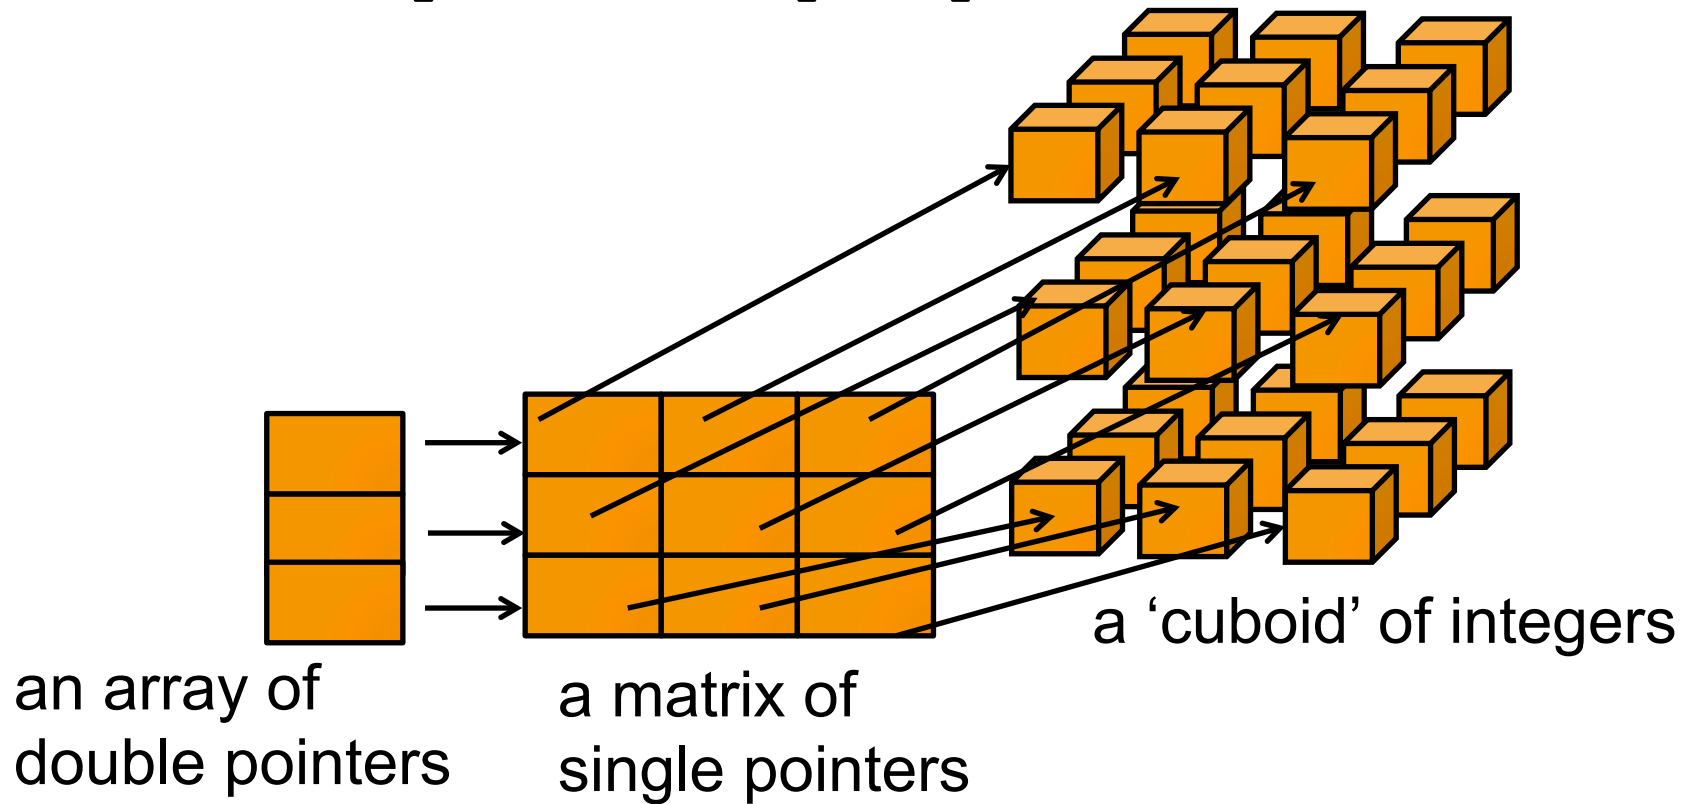

for(i=0;i<4;i++)
    array[i] = (int *)malloc(sizeof(int)*5);
```

an array of integer pointers

Malloc – 3D

```
int ***array; //a triple pointer
```

Problem 2

Dynamically allocate space for a 3-D color image of width, w ; height, h ; color channel, c . Any pixel is accessed as `image[height][width][c]`.

Calloc()

```
void * calloc(int count, int  
size)
```

- Basically the same as malloc!
 - Imagine you want an array of elements...
- Argument 1: # of elements to allocate
- Argument 2: Size of each element in bytes
- Return value: Pointer to the region

Realloc()

```
void * realloc (void *ptr, int  
size) ;
```

- **Resize** a dynamic region of memory
 - Note that it might **move** to a new address!
- **Argument:** Pointer to the original region
- **Argument 2:** Desired size in bytes of new region
- **Return value:** Pointer to the new region
 - It might be at the same address if you made it smaller
 - It might be at a new address if you made it larger

```
#include <stdlib.h>
```

Include this library to use malloc, realloc,
and calloc!

C Structures

Structures are a nice way to bring certain related items together

```
struct database
{
    int id_number;
    int age;
    float salary;
};
int main()
{
    struct database employee; //an object
    employee.age = 22;
    employee.id_number = 1;
    employee.salary = 12000.21;
}
```

**structure objects access
members using dot
operator**

Problem 3 (Important for Lab 4)

Declare a structure called `board` that contains: a double character pointer `matrix`, two integer variables `height` and `width` denoting the number of rows and columns in the matrix.

Inside `main`, do the following:

1. create a structure object called `myboard`, initialize `matrix` to `NULL`, set `height` to 7 and `width` to 7.
2. Dynamically allocate `matrix` to hold `height` x `width` elements

Traversing 2D array

```
main(){
//Assume a is dynamically allocated 2D array
update(a,5,5); //name of array is starting addr.
}

update(int **a,int height,int width) {
int i=0,j=0;
for(i=0;i<height;i++)
    for(j=0;j<width;j++)
        a[i][j]++;
}
```

Problem 4 (Useful for Lab 4)

Refer to Problem 3. Traverse the 2D `matrix` of dimensions `height` (rows) and `width` (columns). Find the first instance of small letter 'e'. Obtain all the letters starting from 'e' placed diagonally downwards in this matrix. Store the letters in a 1D array, `buffer`. Make sure that `buffer` is of large enough size to contain all of the letters.

`free ()` to free the Allocated space

```
free(variable name);
```

Remember to free all of the variables malloc'ed

Problem 5 – Free a 2D array (Useful for Lab 4)

`free()` is actually a reverse operation of `malloc`. The steps you use for `free` is opposite of the steps for `malloc`. Free a dynamically allocated 2D array.

String Operations

C Strings

There is no such thing as a “string” in C!

What do you get? **An array of characters**

- Terminated by the null character `'\0'`

Must manipulate element by element...

- Not enough room in the array? Need a bigger array

Arrays of Characters

```
char phrase []="Math";
```

Null terminator character
(End of string)

Arrays of Characters

```
char phrase[8]="Math";
```

phrase

phrase[0]	phrase[1]	phrase[2]	phrase[3]	phrase[4]	phrase[5]	phrase[6]	phrase[7]
M	A	T	H	\0	???	???	???

```
printf("%s\n", phrase);
```

**Prints until it reaches
the \0 character!**

Helpful Library for Character Arrays

```
#include <string.h>
```

Useful functions

- `strcpy`
- `strcmp` – Google it!
- `strlen` – Google it!
- `strcat`

String Copy

```
char phrase1[] = "Math";
```

```
char phrase2[8];
```

```
strcpy(phrase2, phrase1);
```

phrase1

phrase1[0] phrase1[1] phrase1[2] phrase1[3] phrase1[4]

phrase2

phrase2[0] phrase2[1] phrase2[2] phrase2[3] phrase2[4] phrase2[5] phrase2[6] phrase2[7]

String Concatenation

```
char phrase1[8] = "Comp";  
char phrase2[] = "Sci";  
strcat(phrase1, phrase2);
```

You cannot do this:
phrase2 =
phrase1 + phrase2;

In-Class Participation: String Reversal (Useful for Lab 4)

Assume a character string called `word`. Reverse this string (you can use another character buffer to store the reverse string). For the matrix (note it was part of a structure) in Problem 3, write a C snippet to check if this reverse string is placed horizontally anywhere in the matrix. Feel free to use string functions.

For example, if the word is: elephant, then check if `tnahpele` is in the matrix.
