

Computer Systems and Networks

ECPE 170 – Jeff Shafer – University of the Pacific

Introduction

A Modern Computer – iPad Air "2"

Applications

Application – Angry Birds

- Written in a high level language (Objective C)
- What resources does Angry Birds need to run? (i.e. what does the Angry Birds executable file need to execute?)
 - **7** Hardware
 - → Processor(s) Run program, display graphics, ...
 - Memory Store programs, store data
 - ↗ I/O Touch screen, storage, network, 3-axis gyro, ...
 - Software Operating system

Software - Operating System

- Apple iOS Used in iPads, iPhones, iPods, Apple TV
 - Variant of Mac OS X operating system used on traditional Macs

What are some jobs of this operating system?

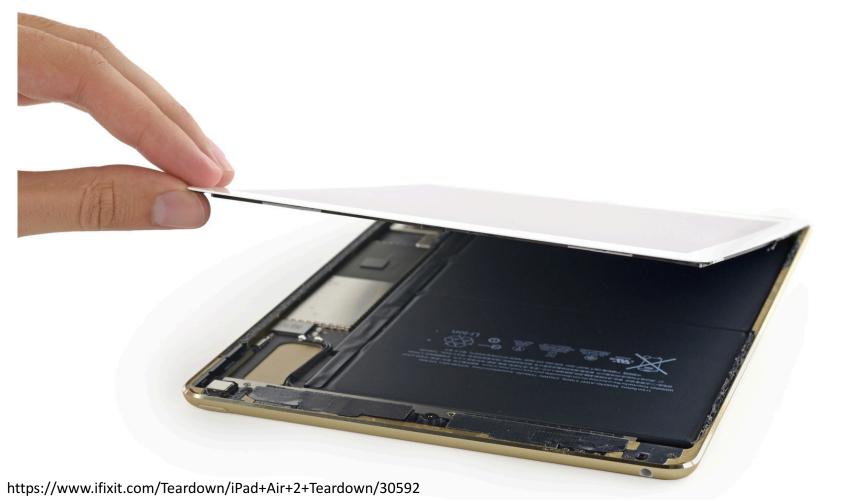

- Manage hardware
- Manage applications (multitasking)
- Written in high-level languages
 - ↗ C, C++, Objective C (varies by component)
 - Can we run this code directly on the processor?

Software - Compilers / Interpreters

- **These are programs that build other programs!**
- Goal: Convert high-level languages into machine code that can be directly executed by hardware
- **Examples**
 - Apple Xcode
 - Microsoft Visual Studio
- What's the difference between a compiler and interpreter?

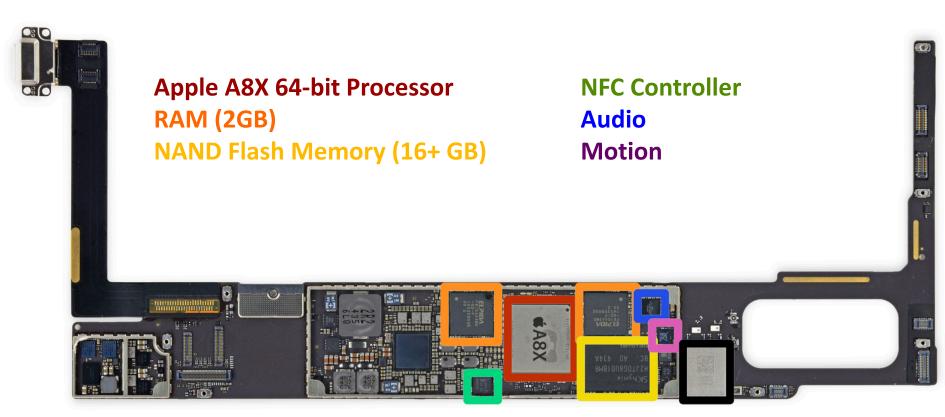

Hardware

Computer Systems and Networks

Hardware

iPad Air "2" Processor

Apple A8X Processor

- ↗ Clock speed 1.5GHz
- **3** cores
- **2**GB RAM

- What do these mean?

What does a processor do?

- Executes machine language instructions
 - Machine language?
- **How does the processor execute the instructions?**

Microarchitecture

How Does It Work?

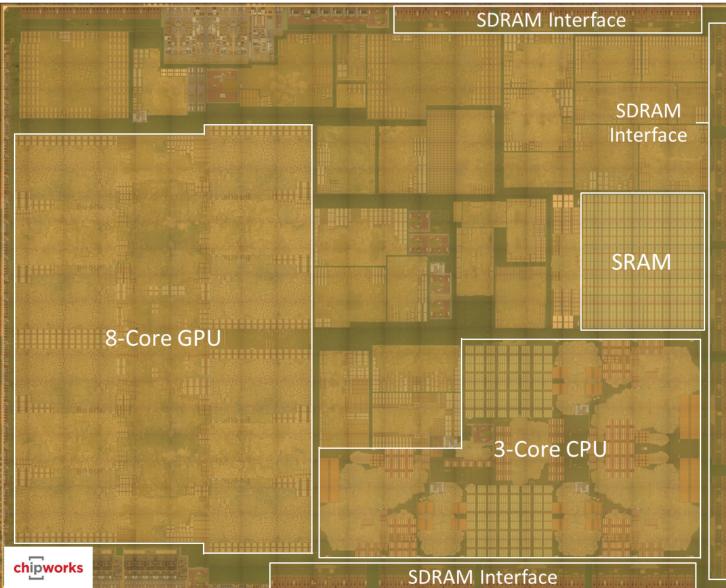

- Apple won't tell us trade secret!
- Experts can dissolve (with acid), burn, or grind off outer protective layers of chip and then peer inside:
 - Need a really good microscope!
 - Reverse Engineering in the Semiconductor Industry: <u>http://www.scribd.com/doc/53</u> 742174/Reverse-Engineering

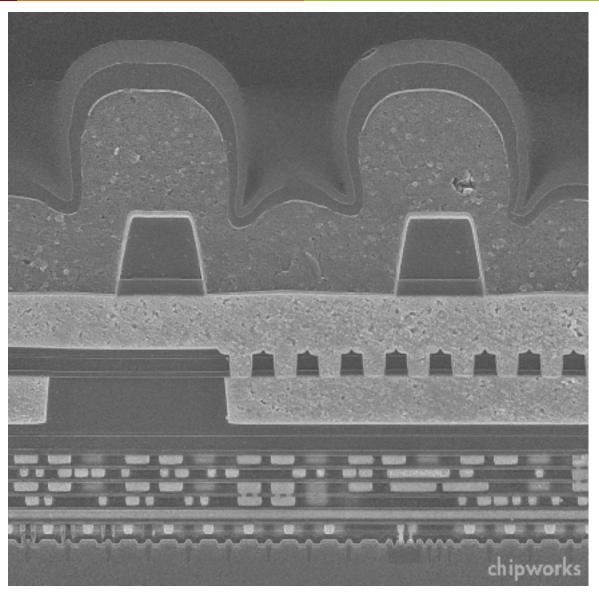

Can see this level of detail with your own eyes...

Divided into logic blocks with different functions:

- Processor
- Cache memory
- Memory Controller
- Video (GPU)

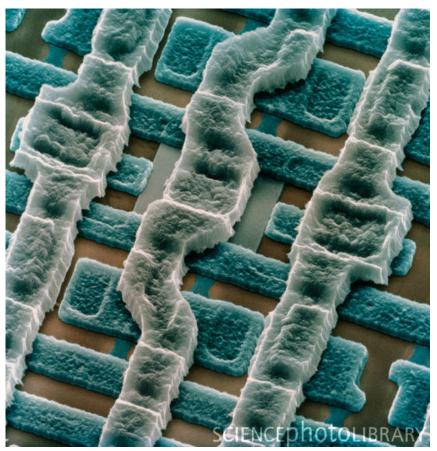

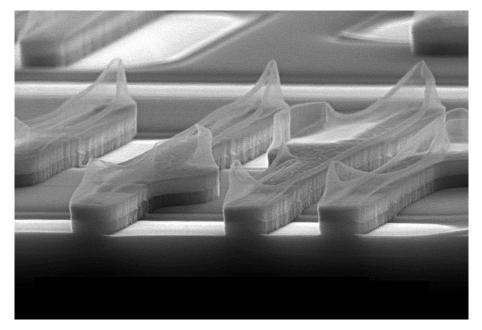

SEM Cross-Section of (older) Apple A5

Digital Logic

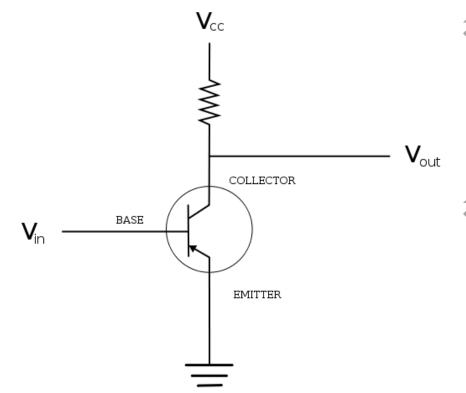

Memory cell

Transistor

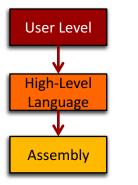

Transistors

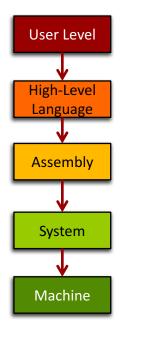

- You can still make
 assumptions at this level that
 the transistor is either "on"
 (1) or "off" (0)
- But below this are analog circuits

The Computer Level Hierarchy

- Level 6: The User Level "Angry Birds"
 Program execution and user interface level
- Level 5: High-Level Language Level "Objective C"
 - Programming languages like C++, Java, Python, ...
- Level 4: Assembly Language Level "ARM Assembly"
 - Program directly at this level, or ...
 - Use a compiler/interpreter to process/convert highlevel code

The Computer Level Hierarchy

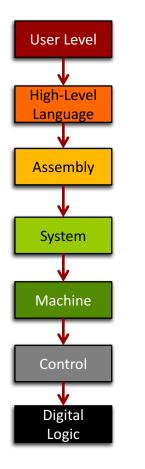

Level 3: System Software Level - "iOS"

- Controls active programs and manages system resources
- Assembly language instructions often pass through Level 3 without modification

Level 2: Machine Level

- ↗ Instruction Set Architecture (ISA) Level
- Instructions are particular to the architecture of the specific machine (i.e. Intel processors, ARM processors, IBM processors...)

The Computer Level Hierarchy

These levels are too hardware-oriented for ECPE 170...

- Level 1: Control Level
 - Decodes and executes instructions and moves data through the system
 - ECPE 173 Computer Organization & Architecture
- Level 0: Digital Logic Level
 - Digital circuits, gates and wires implement the mathematical logic of all other levels
 - ECPE 71 Digital Design ECPE 174 – Advanced Digital Design

Course Overview

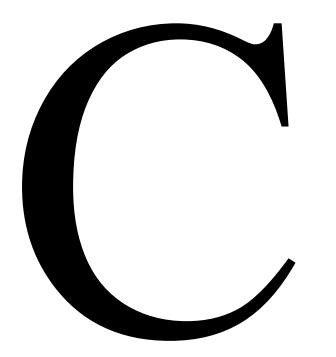

Motivating Question

- What do you, as a programmer, need to know about the underlying system (software and hardware) to write more efficient code?
 - **7** Role of the tools
 - Compiler, assembler, linker, profiler
 - Role of the operating system and its efficient usage
 - Assembly programming (using the CPU efficiently)
 - Memory hierarchy and its impact on performance

Course Goals

- Present a complete view of how computer systems are constructed
 - From the CPU assembly programming level to the user application level
- Understand the relationship between computer software and hardware
- Lay the foundation for future courses
 - Advanced Digital design / VLSI
 - Operating systems
 - Computer networking
 - Application development

C Programming Language

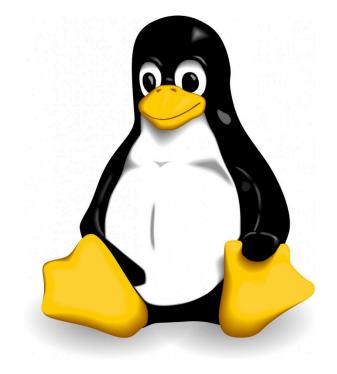

- Why not Python, Java, Ruby, Perl, PHP, ...?
- High-level languages

 (especially interpreted,
 managed code...) try to *hide* the underlying machine
 from you
- ECPE 170 wants to *reveal* the underlying machine to you!

22

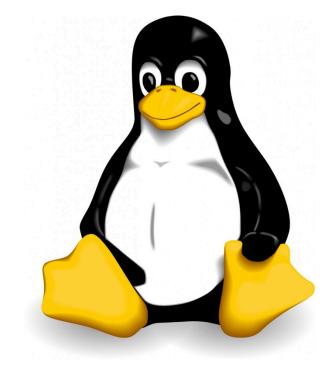

Linux

Course will be taught 100% in Linux

- Did you have to choose Linux for ECPE 170?
- No, not really, but...
 - Too many Pacific graduates were escaping without a working knowledge!
 - Feedback from co-op employers and graduates: "More Linux/Unix skills please!"

Linux

- Who here has used a Linux desktop/laptop/server before?
- Who here has used a Linux "device" before?
 - ↗ I'd be surprised if it isn't everyone...
 - Android runs a Linux kernel
 - Amazon Kindle runs a Linux kernel
 - TiVO runs a Linux kernel

Discussion

- **What is open-source?**
- **What is an operating system** *kernel*?
 - **7** Is the kernel everything you need from an OS?
- What is Linux?
- What is Ubuntu Linux? (RedHat? Debian? ...)
 - **7** \rightarrow Show family tree of distributions \leftarrow

Virtual Machine

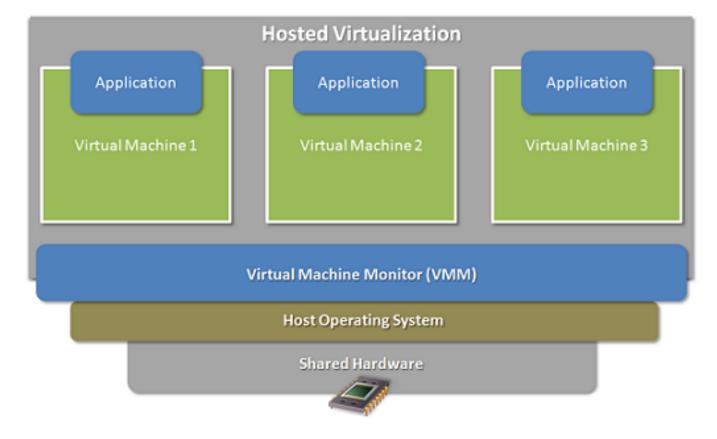

- <u>Course will be taught 100%</u> <u>from a virtual machine</u> <u>booting Linux that you</u> install!
- Couldn't you just give us remote access to a server someplace that is already configured?
- → Yes, but...
 - By installing it yourself you will have the skills to use it again in the future
 - No mysterious "Professor Shafer" software configuration

Discussion

- **What is a Virtual Machine?**
 - **7** Is this the same thing as a *Java* virtual machine?
- How is it different from dual booting?
- Which comes first, the virtual machine, or the OS?
 - Answer: It depends!
 - **7** Typical <u>desktop</u> install: hosted virtualization
 - **7** Typical <u>server</u> install: bare-metal virtualization

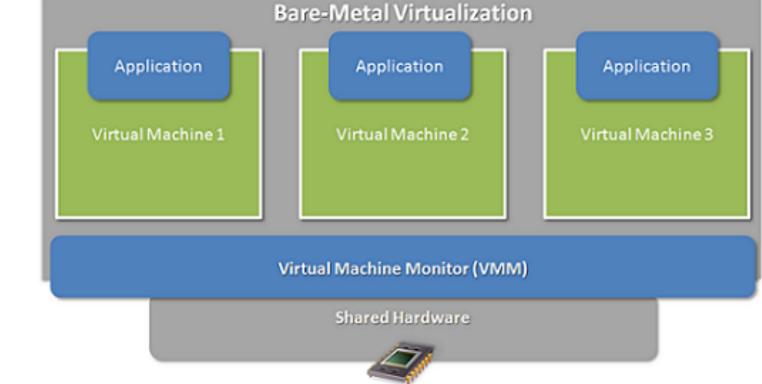

28

Bare-Metal Virtualization

More efficient, but not as easy to install.

The virtual machine monitor acts like an operating system itself!

Version Control

Course will use version control!

- Only way to get lab code or turn in assignments
- Did you have to mandate VCS for ECPE 170?
- No, not really, but...
 - Too many Pacific graduates were avoiding learning this on their own!
 - Feedback from co-op employers and graduates: "Only n00bs work without version control!"
 - Used everywhere: Source code of all kinds! (C++, Python, Matlab, VHDL/Verilog, ...)

Version Control

Who here has used a version control system before?

- → What system?
- → Where at?
- → What purpose?

7 Questions?**7** Concerns?

Course Mechanics

Websites

Main website (syllabus, schedule)

<u>http://ecs-network.serv.pacific.edu/ecpe-170</u>

Canvas website (gradebook)

• http://canvas.pacific.edu

Bitbucket.org (version control)

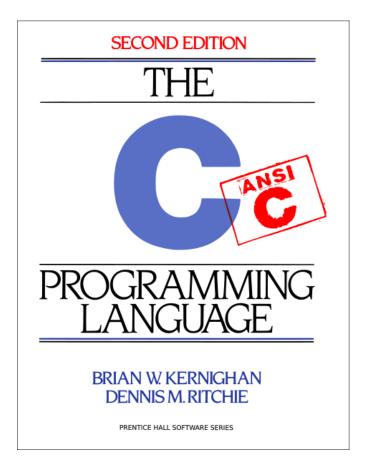

<u>http://bitbucket.org</u>

Textbook

35

No official textbook

- Optional reference books (useful for this class and beyond)
 - The C Programming Language, 2nd Edition
- Please suggest useful online or print references throughout the semester

Grading

36

30% - Exams

- ↗ 15% Mid-term exam
- **7** 15% Final exam
- **70%** Labs
 - Points assigned to each lab will vary based on complexity
 - Each lab *begins* as an in-class activity
 - Unfinished work becomes homework/project
 - Labs are large assume "the usual" amount of homework/projects for a 4-credit class
 - Tip: The best students last semester *started* the labs outside of class, and finished them as an in-class activity

Honor Code

All assignments are submitted individually

Encouraged Activities

 Collaborating with your classmates (asking questions, solving problems together)

Searching for solutions online

- Provided code copied does not exceed 25% of total assignment length
- Provided you clearly document this copy in your source code and lab report
 - What did you copy? Where did it come from?

Honor Code

Risky Activities

Having your classmates type on your computer or assignment file

Forbidden Activities

- Copying someone's work verbatim (classmate or otherwise)
- Copying someone's work and obfuscating its source

Lab Topics

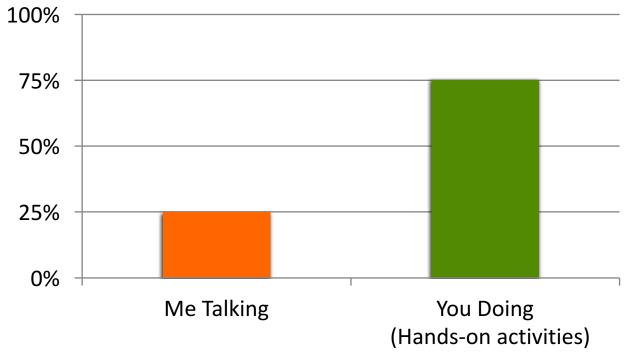

- 1. Linux
- 2. Version Control
- 3. C Programming
- 4. C Programming Project
- 5. Performance Measurement
- Performance Optimization (compiler and programmer techniques)

- 7. Performance Optimization (Memory systems)
- Network Programming 1 (Python)
- 9. Network Programming 2
- 10. Assembly Programming 1 (ARM)
- 11. Assembly Programming 2
- 12. Assembly Programming 3

Class Time

40

The goal[∗] in designing this course:

* Actual time in any specific class may vary

Lab 1 - Linux

Homework

Before the next class

- 1. Skim "Virtual Machine Setup" tutorial instructions on website
 - http://ecs-network.serv.pacific.edu/ecpe-170/tutorials/vm_setup
- 2. Decide on what computer system you want to use for this class
- 3. Download all software
 - Virtual machine installer (VMWare Player)
 - ↗ Linux .iso image (installer) 64-bit version

Next Class - Linux Installfest

- **オ** Tutorial Day
- Objectives
 - Follow the "Virtual Machine Setup" tutorial from website to install Linux
 - Debug individual problems if needed
 - Verify OS works
 - **7** Email me screenshot as proof of success

Next Class - Linux Installfest

- I want you to be comfortable <u>as professionals</u> working independently to solve problems
- If you complete the "Virtual Machine Setup" tutorial independently (<u>and email me a screenshot</u> <u>by Thursday morning</u>), you don't need to attend Thursday's class. Sleep in! (Or come help out)
- I will still be here to answer all questions and solve problems

Next Class - Linux Installfest

Warning: Don't skip class Thursday, and then tell me next Tuesday at Lab #1 that your OS doesn't work!

Lab 1 - Linux

The first lab is next Tuesday

- **7** Topic: Linux
- Crash course in command-line usage

↗ Lab 1: Pre-Lab

- Show me the working command prompt in your Linux install. Hopefully you will have this done by end-of-class Thursday
- Pre-Labs are always due at the start of the lab

Every class – bring your laptop

Every class – bring your laptop!

Every class – bring your laptop!!

(*) Maybe not this one, but you get the idea...

Every class – bring your laptop!!

Just assume we'll do at least *some* lab activity in class unless it's been made crystal clear in advance that a day will be all lecture/discussion instead...

- No laptop? Let's try installing Linux to a USB stick and dual boot the classroom computers.
- See me after class to sign-out hardware...

7 Questions?**7** Concerns?
